### Abstract

*Lodhas* of West Bengal utilize a diversified phyto-resources including forest flora for their survival. The ethnobotanical survey was undertaken in the selected *Lodha* populated villages of six districts of West Bengal, India during 2014-2017 with the objectives of documentation of the phyto-diversity used by the *Lodhas* and making an inventory to enrich the ethnobotanical data base of *Lodha* tribe, West Bengal. In this study, a total of 250 vascular plant species belonging to 83 families along with 728 ethnobotanical uses which belong to the 12 numbers of use categories have been documented. Highest number of species utilized by the *Lodhas* belongs to the family Leguminosae (28), followed by Poaceae (14), Asteraceae (11), Dioscoreaceae (10), etc. Some of the important plants used more frequently by the *Lodha* people in the state of West Bengal are *Aristolochia indica* L., *Asparagus racemosus* Willd., *Dioscorea alata* L., *D. glabra* R. Baron, *Hemidesmus indicus* (L.) R. Br. ex Schult., *Solena amplexicaulis* (Lam.) Gandhi, etc. A number of traditional practices still exists among the *Lodhas* which are employed for conservation of local biodiversity and to ensure the sustainable livelihood of the *Lodha* people.

**Keywords:** Lodhas, West Bengal, Phyto-diversity, Traditional uses, Ethno-conservation

### 1. Introduction

The *Lodha* tribe of West Bengal has been declared as Particularly Vulnerable Tribal Groups (PVTGs) by the Government of India (Bhatt and Bhargava, 2006). They are categorized by a low rate of growth of population, pre-agricultural level of technology and extremely low level of literacy (Particularly Vulnerable Tribal Group-Ministry of Tribal Affairs, 2012). *Lodhas* of West Bengal were designated as one of the ‘criminal tribes’ till the revocation of the Criminal Tribes Act of 1952, India. This criminal propensity of them is not hereditary; the most important cause of their criminality is the loss of their traditional means of livelihood (Bhowmick,

1994). Nearly all areas of West Bengal have received attention of the ethnobotanists. Quite a good number of significant ethnobiological works of West Bengal have been carried out documenting the traditional uses of bioresources by different ethnic communities (Chaudhury *et al.*, 2016; Das and Rahaman, 2014; Mitra and Mukherjee, 2009; Mondal and Rahaman, 2012; Mukherjee and Bauri, 2011; Rahaman and Karmakar, 2015; Rahaman, 2012; Rahaman and Das, 2012; Rahaman and Pradhan, 2011; Rahaman and Saha, 2011). In West Bengal, ethnobotanical work has been focused mostly on dominant tribal groups like Santhal, Oraon, Bhumij, Mahali, Kheria, Munda (Bhakat and

Pandit, 2004; Das and Chattopadhyay, 2001; Ghosh and Sarkhel, 2013; Mitra and Mukherjee, 2009; Pal and Jain, 1998; Rai Chaudhuri and Pal, 1978), but documentation of the ethnobotanical knowledge on *Lodhas* is very scanty (Chaudhury et al., 2017; Pal and Jain, 1989; Pant et al., 1993; Rai Chaudhuri and Pal, 1975; Sarkhel, 2014). It is interesting to note that most of the published literatures on *Lodhas* ethnobotany are either from the undivided Medinipur district or West Midnapore district of West Bengal, although the *Lodhas* are inhabited in other districts of the state like Alipurduar, Bankura, Purulia, South-24 Parganas, Jhargram, etc. No systematic study on ethnobotanical knowledge of Lodha tribe has so far been carried out from those Lodha inhabited districts of West Bengal. According to Census of India, 2001, the population of Lodha and Kharia tribes in West Bengal was 1, 96, 933 (Lodha- 84966 and Kharia-1,11,967) (Bhat and Bhargava, 2006). In 2011, the population of Lodha, Kheria and Kharia tribes was 1, 08,707 (Census of India, 2011). It is found that after ten years the population of Lodha, Kheria and Kharia tribes have been declined to a greater extent i.e. more than 88,000. Though in the census report of 2011, the Lodha population has not been defined separately, but it indicates that there is a sharp decline of populations of the *Lodhas* including Kheria and Kharia tribes. Thus it is understood that population of the *Lodhas* are also declining very rapidly and there is an urgent need to document their indigenous knowledge about plants before it is totally vanished. In this scenario, present study has been undertaken to make an inventory of the phytoresources related to the existing traditional knowledge of this neglected ethnic group of West Bengal.

## 2. Materials and Methods

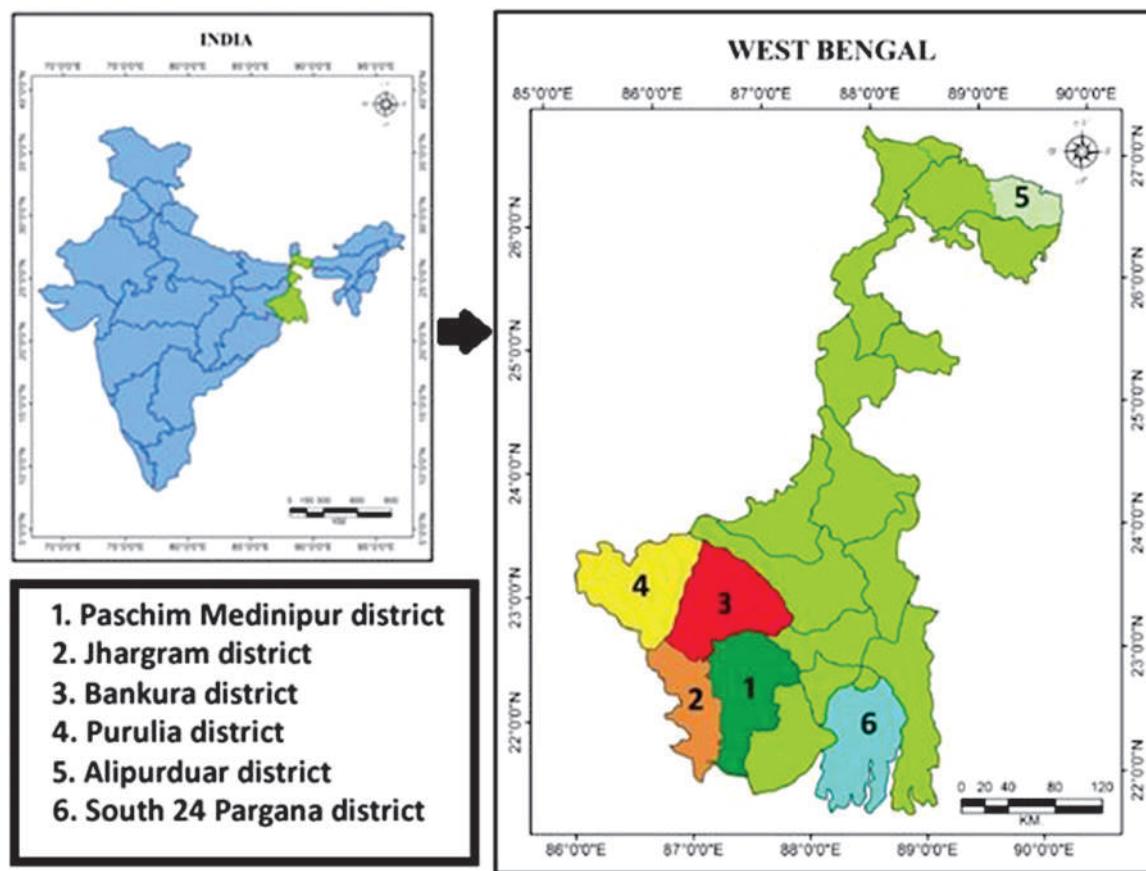

Regular and systematic ethnobotanical surveys were carried out in selected *Lodha* populated villages of Paschim Medinipur, Jhargram, Bankura, Purulia, Alipurduar and South 24 Parganas districts of West Bengal, India during 2014-2017 in different seasons (Figure 1, Map). PIC was taken from the informants. A semi-structured interview was prepared in

local language (*i.e.* Bengali in Oriya accent) before interviewing the informants (Martin, 2008). During field survey two methods namely walk in the wood (*in situ* method) and freshly collected plant materials (*ex situ* method), have been employed for collection of information regarding uses of phytoresources by the *Lodhas*. These two methods are suitable tools used by the ethnobotanists all over the world to get maximum precise information (Thomas et al., 2007). A total of 178 informants were interviewed during this survey. Collected plant specimens were identified with the help of local flora (Anonymous, 1997; Paul et al., 2015) and one set of herbarium specimens deposited as voucher at the Central National Herbarium, Howrah (CAL). Herbarium specimens of another set were deposited in the Ethnobotanical Herbarium of Central Botanical Laboratory, Botanical Survey of India, Howrah for future references. The scientific names of the plant species were updated from ‘The plant list, 2010’.

## 3. Results and Discussion

The present investigation has been carried out to record the information regarding traditional or folk uses of plants by the *Lodhas* as medicine, wild edible, fodder, non timber forest products, poison, narcotic, dye, etc. (Figure 2). The plants associated with the sacred groves, religious faiths and beliefs of the Lodha tribe were also documented.

In this study, 250 species with 728 ethno botanical uses have been recorded which are used by *Lodha* tribal community for various purposes of their livelihood. The recorded 250 plant species belong to 83 families which are distributed in three major groups of vascular plants - dicotyledons (202 species), monocotyledons (46 species) and pteridophytes (2 species). The highest number of species used by the *Lodha* people are from the family Leguminosae (28 species), followed by Poaceae (14), Compositae (11), Apocynaceae (11), Dioscoreaceae (10), etc. Recorded 250 species have been enumerated in a tabular form along with their families, field numbers and use categories (Table 1).

**Fig.1.** Map of the surveyed districts of West Bengal, India

The 250 recorded plant species were used for 728 ethnobotanical uses which are grouped under 12 use categories like B-Beverage, C-Conservation, F- Fodder, DY- Dye- yielding plants, EM- Ethnomedicine, V-Veterinary, WEP- Wild edible plants, MIS- Miscellaneous, MR- Magico-religious, N- Narcotic, NTFP- Non-timber forest product, P-Poison and PI-Poison indicator. About 215 number of plant species come under the use category of ethnomedicine, which is followed by wild edible plants category or WEPs (112 species), Non timber forest products or NTFP (32 species), 22 species as veterinary plants, 18 species for magico-religious and conservation purposes, 15 as miscellaneous purposes, 10 as poison, 5 as fodder, 5 as narcotic and 2 as poison indicator.

It has been noticed that 215 plant species are used in 472 ethnomedicinal uses by the Lodhas

of West Bengal. Among the 472 ethnomedicinal uses, 28% are used as monoherbal preparation, i.e. single plant is involved in one herbal preparation and 72% are of polyherbal preparations where more than one plant is used in a single ethnomedicinal preparation. As far as the method of preparation and mode of uses are concerned, 139 preparations are used as paste, 105 as powder, 46 as fresh and raw, 50 as decoction, 8 as soaked in water, 48 as juice and sap, 27 as boiled, 10 as cooked, 12 as roasted, 6 as oil, 1 as ash, 4 as warm, 3 as for chewing, 2 as fried and 3 as burnt to cure the disorders. Most of the remedies are administered orally (64%) which are followed by topical (35%) administration and inhalation (1%). During preparation of remedies, some adjuvants like milk, honey, crystal sugar or '*michhri*', mustard oil, rice powder or '*chawl guro*', rice washed water or '*chawl dhua jal*',

egg, rice beer or ‘*handia*’, country liquor, coconut oil, coconut water, *Papaver sominiferum* or ‘*afim*’ are commonly added. Dosages and duration of remedies may vary according to the severity of ailments and age of the patients. It has been observed that for 472 ethnomedicinal uses, leaves are used by the *Lodhas* in highest number (145 in number), followed by root (88), fruit (79), bark (44), whole plant (36), latex (21), stem (12), seed (11), tuber (18), flower (8), rhizome (17), stem sap (2) and thorn (2). Here, 215 ethnomedicinal plant species are used in the preparation of 472 formulations which are used in curing about 23 categories of diseases/ailments like Dermatological disorder (53 species), Gynecological disorder (49 species), Muscular-skeletal system disorder (44 species), Gastro-intestinal and digestive system disorder (60 species), ENT and respiratory disorder (26 species), Diabetes (21 species), Urinary disorder (8 species), Male disorder (7 species), Hypertension (3 species), Hair care (9 species), Fever and Pain (32 species), Dog bite (5 species), Snake and scorpion bite (23 species), Insect bite (2 species), Dental care (9 species), Nervous system disorder (2 species), Malaria and jaundice (8 species), Chicken pox (1 species), Piles (6 species), Cancer (2 species), Physical Weakness (2 species), Obesity (5 species) and Pediatric care (5 species).

It is noticed that about 101 plant species along with their 487 number of ethnobotanical uses are reported here for the first time from the *Lodhas* of West Bengal. Nearly 320 of the ethnomedicinal uses are also found new, as they have not been recorded earlier in the reports on ethnobotany of *Lodhas* from West Bengal as well as India (Jain, 1991; Pal and Jain, 1989; Pant et al., 1993; Rai Chaudhuri and Pal, 1975; Sarkhel, 2014). Some of the uses of medicinal plants by the *Lodhas* found new are: *Baliospermum solanifolium*, *Cheilocostus speciosus*, *Desmostachya bipinnata*, *Ehretia laevis*, *Cannabis sativa* are used in gynecological treatment; *Alstonia scholaris*, *Artocarpus heterophyllus*, *Capparis zeylanica*, *Ehretia laevis* are reported for skeletal and muscular diseases; *Gouania microcarpa* for

ear pain; *Cajanus scarabaeoides* helps to quit smoke; *Cleistanthus collinus*, *Salacia chinensis* for hair growth and treatment of dandruff, to get rid of lice; *Mimosa rubicaulis* used in fever and *Madhuca indica* as tranquilizer. Out of 215 medicinal plants used by the *Lodhas*, very few of plant species have been studied for the scientific validation of their therapeutic properties. It is the need of the hour to study this vast medicinal plant diversity of *Lodha* medicine systematically and to validate their ethnomedicinal claims.

A number of traditional practices for conservation of plant resources have been noticed among the *Lodha* tribe of West Bengal. Like other tribal communities, *Lodha* community in West Bengal has the traditional belief that plants are sacred in nature. Near the village premises or in the forests, some areas covered with plants are considered by the *Lodhas* as sacred groves and are protected due to their religious faith or taboos. These plants and forest areas are protected since ages and utilized only for socio-cultural and religious practices like worship, death ceremonies and other temple rituals. The plants like *Symplocos racemosa*, *Baliospermum solanifolium*, *Vanda tessellata* etc., are worshiped as God by them and are prohibited from being destroyed.

They have immense knowledge regarding the time and seasons of collection of medicinal plants or plant parts. In respect of the time and seasons, some restrictions are there for collection of plants. *Alstonia scholaris*, *Anacardium occidentale* and some other medicinal plants are not being collected during their flowering seasons. *Bytneria herbacea*, *Aristolochia indica*, *Catharanthus roseus* are most preferably collected in the morning. Diurnal as well as seasonal restrictions in collection or harvest of such medicinal plants ensure their conservation to some extent.

During harvest of the underground parts of some useful parts, some portions of their root, tubers, rhizomes, etc., are left underground by the *Lodha* people as vegetative propagules for next growing seasons. In this way, important wild plant species like different species of *Dioscorea*,

*Smilax zeylanica*, etc., are conserved. Moreover, underground parts of *Curcuma caesia*, *Curcuma aromaticum*, *Euphorbia fusiformis* are kept in cool places of the house for cultivation in next season and thus the germplasm of all these important plant species is being maintained year after year.

For certain valid reasons access to the forest resources by the Lohda people is very limited. Hence, many of this forest dwelling tribes have opted for agriculture as an alternative means of their livelihood. Generally, cultivation of a few rice varieties is encouraged among the farmers considering their high yield. It is interesting to note that in spite of their poor yield, few numbers of landraces of many crops including rice are being cultivated by the Lohdas even now. Two rice land races namely “*Badsha vog*” and “*Mota hajar dash*” are cultivated by them in Paschim Medinipur. In this way, germplasm diversity of landraces of certain crops is being maintained.

Establishment of kitchen garden in their house premises is a common practice among the *Lohdas*. Many important plant species are planted and maintained round the year in their kitchen gardens, so they can use the plants whenever required. Mostly, herbaceous plants are planted in the kitchen gardens like *Cannabis sativa*, *Curcuma caesia*, *Carica papaya*, *Piper betle*, etc. Moreover, *Morus indica*, *Pterospermum acerifolium*, *Diospyros malabarica*, *Azadirachta indica*, *Litsea glutinosa*, different *Ficus* species and many other plants of utmost importance are also planted by the Lohdas in the village premises and nearby houses to conserve the phyto-resources.

#### 4. Conclusion

From this study, it is clearly understood that the Lohdas of West Bengal have very rich traditional knowledge regarding utilization and

conservation of the phyto resources. About 250 species of angiosperms and pteridophytes are used by the people of *Lohda* tribe in the 12 numbers of use-categories which basically highlight a large body of information regarding ethnobotanical knowledge of this primitive tribe on locally available phyto-resources and its sustainable uses. Further studies have to be conducted to document more information regarding the traditional knowledge of this tribal group attached with the plant resources from other states of India. Finally, an inventory of the Ethnobotany of *Lohda* tribe of India can be prepared compiling all the state level information documented. The information on ethnobotany of the *Lohdas* of West Bengal documented in this study will also protect the IPR of this tribe. Further, scientific validation of ethnobotanical as well as ethnomedicinal claims need to be carried out through phytochemical and pharmacological studies for the development of novel compounds. More attention has to be paid for the conservation of important plant species used by *Lohdas*. Combination of both modern conservation strategies and traditional conservation practices is needed to frame the conservation strategy for protection of the vast phyto-resources used by this vulnerable tribe.
