Abstract

Epilepsy is a common chronic neurological disorder prevalent world wide. It requires long term treatment with available antiepileptic agents but the associated side effects and incomplete success rates in treatment are some challenges in front of mankind. Traditional treatment of epilepsy through various plants is also very popular in rural and tribal belts of India. An attempt was made to gather information about antiepileptic plants being used by different indigenous communities all over the country. It has revealed use of total 159 plants for treatment of epilepsy and its related symptoms in India. Out of these, 55 plants have been evaluated for their anticonvulsant potential in various biological studies. There is an urgent need for scientific evaluation of rest of the 104 plants for their antiepileptic potential to obtain a safe, efficient and cost-effective treatment for this serious brain disorder.

Keywords: *Anti-convulsant, Ethnobotany, Seizure, Alkaloid, Secondary metabolites*

Introduction

Man has been dependent on natural resources for the treatment of various health problems since prehistoric times. Plants remained the foremost important source for this purpose. India has a very rich biological and cultural diversity and indigenous people of India have been using different plants singly or in combination for treatment of various medical conditions.

Epilepsy is a major Central Nervous System disorder and its most important symptom is recurrent unprovoked seizures. Traditional healers also associate other symptoms such as loss of consciousness, dizziness, abrupt falling down, frothing from mouth, tongue biting, confusion, memory loss and restlessness under epilepsy. In earlier days, most of the time, it was believed to be caused by witchcraft and many exorcists were contacted for its treatment. Later on, plants were started being used for treatment of epilepsy and associated symptoms.

In modern era, many synthetic drugs like phenytoin, barbiturates, pyrimidon, succinamides, dizepines, benzodiazepines, carbamazepine, topiramate etc. are being used as anticonvulsant/antiepileptic drugs. However, their side effects, chronic toxicity, serious drug interactions and adverse effects on cognition and behavior still require a safe & effective drug for this unpleasant disorder. Plants have proved to provide effective solutions for various diseases, for example discovery of drugs like quinine, artemisin, digoxin, atropine, strychnine, rauvolfine and many more. Primary healthcare need is mostly satisfied through folk or herbal remedies in developing countries due to their safety profile, efficacy and cost-effectiveness (Muralidharan *et al.*, 2009). In view of this, an attempt was made to collect information about plants being used for treatment of epilepsy among folklore of India and scientific studies done so far to validate their antiepileptic/anticonvulsant potential.

Methodology

An extensive literature search was carried out to look for plants being used ethnomedicinally for treatment of epilepsy by different tribes of India. After consulting work of Jain (1991), more than 1000 references published on ethnomedicinal plants of India were also consulted. Out of them, 108 references were providing information about plants being used for epilepsy in various parts of the country. Articles were also consulted to check for scientific validation studies done on these folk claims (Nsour *et al.*, 2000; Junior *et al.*, 2008; Golwala *et al.*, 2010; Romeiras *et al.*, 2012; Asif, 2013; Fathima *et al.*, 2015). Correct botanical identity of plants were adopted from well known websites (Website 1 & 2). A list of plants with their scientific names, family, part used and references for the information along with information about scientifically proven antiepileptic/anticonvulsant potential of the plants is given in Table 1.

Result & Discussion

A total of 159 plants were found to be used traditionally for treatment of epilepsy either individually or in combination among various tribes of India. Out of these, 7 plants belong to Pteridophyta and one belongs to Gymnosperm groups. Rest 151 plants belong to Angiosperm group out of which 133 are Dicots and 18 are Monocots. Among the plant parts, maximally used for treatment were roots; leaves and whole plants; while petiole, latex, twig, wood and cotyledon were least used parts (Table 1). Antiepileptic plants

were maximally reported from West Bengal, Bihar, Orissa, Sikkim, Chhattisgarh and Jharkhand region, then from Madhya Pradesh, Andhra Pradesh and Maharashtra states and Northeastern states of India *i.e.* Assam, Manipur, Meghalaya, Mizoram, Nagaland, Tripura and Arunachal Pradesh.

Jain (1991) has compiled ethnobotanical data published up to year 1991 in his Dictionary which provides information about 43 antiepileptic plants being used in country. After 1991, many researchers all over the country have started documenting folklore information about plants and animals. Literature search of published data on ethnomedicine after 1991 has revealed use of 140 plant species for epilepsy treatment out of which 24 species were common both before and after 1991. It elucidates expansion of information about another 116 plants being used for epilepsy after 1991 among various indigenous communities of India. Documentation of folk knowledge about various ailments is therefore, quite necessary to catch the dynamism going on in the field of ethnomedicine in modern generation.

There are many herbal formulations prevalent in markets for treatment of epilepsy and majority of them contain extracts of *Withania somnifera*, *Bacopa monnieri*, *Asparagus racemosus*, *Rauvolfia serpentina*, *Nardostachys jatamansi*, *Centella asiatica*, *Acorus calamus*, *Piper longum* etc. (Fathima *et al.*, 2015). It is interesting to note that use of these plant species for treatment of epilepsy have also been reported in Indian folklore (Table 1).

Table 1: List of plants used for treatment of epilepsy in ethnomedicine

* Plants showing anti-convulsant activity

Anticonvulsant potential of many phyto-extracts have been evaluated in various animal models like pentylenetetrazole (PTZ), maximal electroshock (MES), kainic acid (KA) and bicuculline, pilocarpine, strychnine or N-methyl-D-aspartate (NMDA)-induced convulsions. In the present paper, out of these 159 plants, 55 plants have been found to demonstrate anticonvulsant activity in various animal studies (Nsour *et al.*, 2000; Junior *et al.*, 2008; Golwala *et al.*, 2010; Romeiras *et al.*, 2012; Asif, 2013; Fathima *et al.*, 2015) and this potential could be scientifically explained by direct or indirect pharmacologic mechanisms acting against epileptic symptoms. It suggests that folk medicinal claim to treat epilepsy by rest of 104 plants still needs scientific validation. These potential plants could be investigated for their antiepileptic potential in various animal models and plants with positive response could be further explored for active constituents.

Plants possess various medicinally important phyto-constituents like alkaloids, flavanoids, coumarins, terpenoids, saponins *etc.* Many of these secondary metabolic compounds also possess anti-epileptic potential, for example alkaloids like piperine present in *Piper* species, Raubasine in *Rauvolfia serpentina*, flavanoid like fisetin in Grapes & Onions; terpenoids like cannabidiol, delta-8-tetrahydrocannabinol, delta-9-tetrahydrocannabinol in *Cannabis sativa*, bacoside-A in *Bacopa monnieri*, citronellol in *Cymbopogon* species have demonstrated antiepileptic/ anticonvulsant potential in different animal models (Zhu *et al.*, 2014). Similarly, other potential plants should be thoroughly investigated for search of anti-epileptic molecules.

Conclusion

The healing power of ethnomedicinal plants for treatment of various diseases is under scientific appraisal all over the world. Epilepsy affects approximately 50 million people worldwide and

toxicity, adverse drug interaction and expensive nature of present synthetic drugs require novel safe and cost-effective molecules for its treatment. Indian folklore describe use of 159 plant species for its treatment but only about 34% of them have been therapeutically validated. The rest of the 104 folk medicinal plants could be explored scientifically and further research on isolation of bioactive compounds could provide an effective treatment for epilepsy and associated symptoms.
