Abstract

A study on the socio-biodiversity was conducted in Kotagarh Wildlife Sanctuary (KWS) and nearby areas of Odisha, where the population of Kutia-Kandha tribe is dominant. It was found that, forest has provided tribes with enough materials for traditional used for therapeutic purpose. Information from secondary sources by interviews were conducted in eight villages surrounding Kotagarh Wildlife Sanctuary, in which 34 males, 22 females in the age group of 35 -75 and 8 therapeutic practitioners of Kutia Kandha tribe of Odisha were consulted. The tribes reported 54 different diseases, cured from 52 plant species belonging to 51 genera and 32 families, which are used for ethno medicinal practices. The Fabaceae found to be the dominant family among plants used for medicinal purpose, whereas for ethnozoological use, a total of 8 mammalian species were used for curing 17 different diseases, most of them are either threatened or endangered species. This paper narrates the ethnobiology and socio-biodiversity aspects of Kutia-Kandha community of Odisha, along with suggestions for alternate source of medicines for the Kutia-Kandha, to reduce dependency on forests product and reduce hunting of wildlife.

Keywords: Traditional knowledge, Medicine, Conservation, Tribes, Odisha

1. Introduction

The study of human interactions, biodiversity and the environment that surrounds them is discernment to human welfare and resource from the earth appears to be a promising discipline that can play a key role in the field of traditional knowledge and biodiversity management. The study of the relationship between plants, animals, people and environment is termed as Ethnobiology (Albuquerque and Alves, 2016). In a broader aspect, it is the cultural values and medicinal use of the plants around them by the local communities (Arshad *et al.*, 2014). The traditional knowledge and management of the biological resources by local communities

are important to improve the understanding and management of local and regional levels of conservation measure for flora and fauna (Dalle and Potvin, 2004). The indigenous community have tremendous knowledge on the use of plants and animals around them and how different species are used locally for therapeutic purpose (Amjad and Arshad, 2014). According to Sheldon *et al.* (1997) primary health care depends on traditional medicinal practices in developing the world. This aspect makes medical ethnobiology, an extremely important aspect and contributes to the knowledge and conservation of plant and animal derived medicines (Hedberg, 1993).

The *Kandha* tribe are numerically the largest tribe of Odisha with four functional groups viz. *mondal*, *bismajhi*, *jani* and *pujari*. A similar tribe *Kutia Kandha* mostly inhabit the Tumudibandha Block of Kandhamal district and Lanjigarh Block of Kalahandi district of Odisha and their tribe named after their house floor, below the level of the village road. A third category inhabit the high altitude hilly terrain of Odisha, they are popularly called as *Dongria Kandha*. They are mostly found in Bissamkattack and Muniguda Blocks of Rayagada district of Odisha. Other than this, there are sub-groups of the Kandha tribe like Sitha Kandha, Buda Kandha, Desia Kandha and Malua Kandha live in Koraput, Kandhamal and Bolangir districts of Odisha. The Sitha Kandhas (*Sitaranga*) are basket makers. The Malua Kandhas are well-known for their patterns of living in groups in hilly areas for which they are called so. On the other hand the Desia Kandhas are found in ‘desh’ or plains area for which they are called Desia Kandha. Accordingly to the population census of 2011, there the population of Kandhas is 627486 and the literacy rate is 46.95 % with males educated more than 50% of the total population. The population of Kandhas in Kandhamal district of Odisha is estimated to be 366784 (Anonymous, 2011). Similar to that of North Eastern Tribes, the Kandhas of Odisha also practice *jhuming* cultivation for agriculture in which mandia (*Eleusine coracana* Gaertn.), koshla (*Panicum vulgare*), Kandul (*Cajanus cajan* Millsp.), Jhunga (*Vigna unguiculata* Walp.), which are cereals, are the major seasonal crops. Apart, they also collect important forest produces viz. fire wood, bamboo, Kendu leave (*Dyospyros*

melanoxylon Roxb.) and Sal leaves (*Shorea robusta* Roth) etc. used for variety of purpose such as making thatched house, baskets, disposable plates (*khali*), bidi, country liquor (with Mohua flower) for their own use.

2. Materials and Methods

2.1 Study Area

The present study was conducted in Kotagarh Wildlife Sanctuary (KWS) and nearby areas, where the population of Kutia-Kandha tribe is dominant. The KWS constitutes a forest area of 269.50 km² and the revenue land of 129.99 km² comprising a total extent of 399.50 km² which forms the core area with native flora and fauna. The sanctuary is a part of Kotagarh-Chandrapur elephant corridor and is typical forest patch of Mahanadian Biogeographical sub-region of Odisha. This area is having a great ecological importance with a variety of flora and fauna of peninsular Indian Sub-Continent of Eastern Ghats of Biotic Province (6-D) of the Deccan peninsular zone (6) (Rodgers and Panwar, 1968). According to Champion & Seth (1968), the forest type categorised into Moist Peninsular Sal Forests, Moist Sal Savannah and Dry Bamboo Brakes, with the dominant plant species viz. Sal (*Shorea robusta*), Vijayasar (*Pterocarpus marsupium*), Asan (*Terminalia tomentosa*), Mahua (*Madhuca indica*), Kaim (*Mitragyna parvifolia*), Kassi (*Bridelia retusa*) and Bans (*Dendrocalamus strictus*).

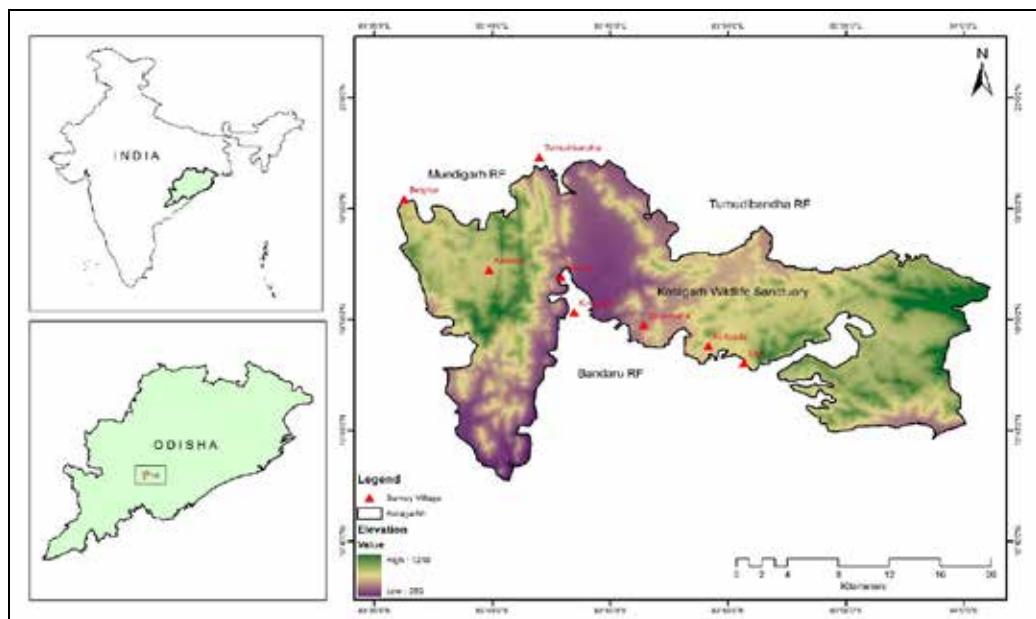

Figure 1. The location of tribal surveyed village in Kotagarh wildlife sanctuary, Odisha

Methods

Ethnobiological data were collected between September 2012 to July 2013 from different parts of the sanctuary, based mainly on semi-structured interviews using questionnaire among the local tribes, health practitioners, and local healers. They were interviewed *viz.* local name of plants and animals, parts used, mode of preparation and use, disease cure and recommended doses, etc. The plant identification was done based on The Flora of British India (Hooker, 1872-1897); whereas, for ethnozoology, the mammalian species were identified based on the standard field guide (Menon, 2003). The collected information was scrutinized and compiled in a tabular form for further analysis purpose. Since, the study was undertaken in the Protected Area and as per law under the Wildlife (Protection) Act, 1972 and enacted by the Forest Department of Odisha for prohibition of any collection from inside

the National Parks and Sanctuaries. Therefore, no collection of plants was made or herbarium prepared. Also, since the plants are popular in nature and the authors are well acquainted with the species identification, majority of them were possible to be identified in the field itself. For those doubtful species, photographs were taken on the body parts, leaves and flowers and with the help of field guide, were identified up to species level.

2.3 Quantitative Analysis

The extract ethnobiological data was used for calculating the Relative Frequency Citations (RFC) to know the local importance of each medicinal plant among the tribe.

The Relative Frequency of Citations (RFC) was calculated as follows:

$$RFC = \frac{N}{NI} \quad (0 < RFC < 1)$$

Where, N is the number of informants, who mention the medicinal use of the plant/animal and N_i is the total number of participants in the interview/questionnaire ($N=64$). An RFC of one would indicate that all informants recognized the plant as medicinal and cited at least one use, whereas, an RFC of zero would indicate that no informants cited a medicinal use for the plant.

The fidelity level (FL) is the percentage of informants reporting the use of a particular plant/animal for the same purpose, was determined to find out the most frequently reported diseases (Friedman *et al.*, 1986).

The Fidelity Level was calculated as follows:

$$FL(\%) = \frac{N_p}{N} \times 100$$

Where, N_p is the number of informants independently reporting a use of a plant/animal in the treatment of a particular ailment, and N is the total number of informants using the plant/animal as ethnomedicine in the treatment of any particular disease.

The use value (UV) is a quantitative method that is used to calculate the relative importance of plant/animal species known locally (Phillips and Gentry, 1993; Dey *et al.*, 2016).

The Use value index was calculated as follows:

$$UV = \frac{\sum U}{n}$$

Where, U is the total number of citations

per species and n is the number of informants interviewed for a given plant

3. Results and Discussion

A total of 64 persons were interviewed in eight villages surrounding the KWS, of which 34 were males, 22 females of age group between 35 -75, along with 8 local healers of Kutia Kandha tribe of Odisha were also consulted. The local community comprising mainly of Kutia-Kandha, reported 54 different diseases cured from 52 plant species belonging to 32 families and 51 genera which they used for ethnomedicinal practices (Figure. 2). A perusal of analysis indicates that, among the plants, Fabaceae family is dominant for medicinal practices by Kandha tribes whereas among animals, a range of species, at least eight among them, all mammalian body parts, are popular in use for ethnozoological purpose curing 17 different types of ailments (Table 2). It was observed that the plant roots are predominately used for making medicines (30%), although a mixture of leaves (22%) and fruits (13%) are also used for the purpose. The details of vernacular name, scientific name, family, part used for medicine, mode of preparation, disease cure and recommended dose as revealed by the interviewed tribes and healers are listed in the table 1 and 2.

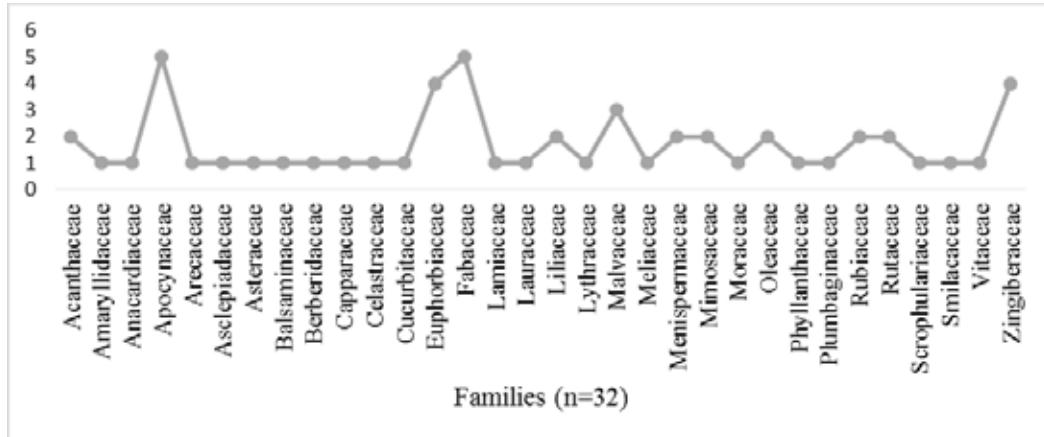

Figure 2. Family wise representation of plant species used as in ethobotanical remedies.

The quantitative data shows that *Pongamia pinnata* (0.968), *Azadirachta indica* (0.953) and *Mangifera indica* (0.906) have the highest relative frequency citation (RFC) in plants and *Hystrix indica* (0.250), *Elephas maximus* (0.219) and *Sus scrofa* (0.094) have the highest relative frequency citation among mammalian species. The Fidelity level (FL) of *Pongamia pinnata*, *Azadirachta indica* and *Mangifera indica* is also maximum in plants and *Hystrix indica* (25%),

Elephas maximus (21.875%) and *Sus scrofa* (9.375%) in animals. Nevertheless, the Use Value Index of *Aegle marmelos* (0.078), *Mimosa pudica* (0.047) and *Lawsonia inermis* (0.047) among plants, and *Panthera tigris* (0.094) among animals is used for curing maximum disease, whereas *Rusa unicolor* (0.047) and *Hystrix indica* (0.047) showed equal value in ethnozoological prospective (Table 1 and 2).

Figure 3. Parts of plants used for ethnobotanical purpose by Kandha tribes of Odisha.

The traditional knowledge of medicinal plants and animals used for medicine of this region were documented for the first time and local medicinal knowledge from Kutia Kandha tribe is known. The current survey reveals that a total of 52

plants species and 8 mammalian species are used by the primitive tribes Kutia Kandha, for curing disease in this remote forest area of Odisha. We also found that all the traditional healers have strong faith towards ethnomedicines although

they are less aware about the documentation and preservation of ethnomedicinal values. Nevertheless, it is believed that ethnobiological practices are an important part of the primary healthcare system and therefore, need to be promoted, patented and tribal rights protected on use of traditional knowledge and ethno-biodiversity. Contrary to this, it is also evident from this documentation that, there are 8 animals or atleast their body parts are used for traditional medicine practices and most of them are either endangered or threatened species as per the list of IUCN (World Conservation Union) as well as listed in the Wildlife (Protection) Act, 1972 of Government of India (see Table 3).

Conclusion

The protection and conservation of the wildlife is equally important and with the traditional hunting by the tribes pose threats to the population and must be curbed with alternate ways. The Government of India and the state Government of Odisha should come up with better health facilities in the tribal district with distribution of medicines free of cost for the ailments as well as the enforcement agencies should create awareness among the tribal for refrain from hunting practices.

Acknowledgements

The authors would like to thank the Kutia-Kandha tribe of Odisha. We are also thankful to PCCF and Chief Wildlife Warden, Govt. of Odisha and forest staff of Kotagarh Wildlife Sanctuary for sharing information available in the department and also for giving us permission to carry out the above study. Our special thanks to all local healers and medicinal practitioners (Kabiraj), for their valuable description of various medicines and participation in interviews.

69	Ashoka	<i>Saraca asoca</i> (Roxb.) Wild.	Fabaceae	Bark	Decoction	Infertility	3 times	0.297	29.688	0.016
70	Muturi	<i>Smilax zeylanica</i> L.	Smilacaceae	Root	Powder	Metrorrhagia	take in empty stomach	0.063	6.25	0.016
71	Banakapa	<i>Thespesia lampas</i> (Cav.) Dalzell & A. Gibson	Malvaceae	Fruit	grind	Nausea	2 times/day	0.016	1.563	0.016
72	Golachi Lata	<i>Tinospora cordifolia</i> (Thunb.) Miers	Menispermaceae	Leaves	grind	Rheumatic disease	1 tea spoon/ day	0.563	56.25	0.031
73	Golachi Lata	<i>Tinospora cordifolia</i> (Thunb.) Miers	Menispermaceae	Leaves	Decoction	Pyrexia	10ml/day	0.563	56.25	0.031
74	Ada	<i>Zingiber officinale</i> Roscoe	Zingiberaceae	Stem	Grinding and mix with a pinch of salt	Cough	3 times per day	0.813	81.25	0.031
75	Ada	<i>Zingiber officinale</i> Roscoe	Zingiberaceae	Stem	Grinding and mix with 7 Black pepper, Honey	Dry Cough	3 times per day	0.813	81.25	0.031
76	Ekangi	<i>Zingiber zerumbet</i> (L.) Roscoe ex Sm.	Zingiberaceae	Whole parts	Grinding	Syncope	twice per day	0.094	9.375	0.031
77	Ekangi	<i>Zingiber zerumbet</i> (L.) Roscoe ex Sm.	Zingiberaceae	Whole parts	Extract oil	Paralysis	2 times /day	0.094	9.375	0.031

Table 2. List of mammalian species along with their medicinal use, RFC, FL (%) and UV index.

Sl. No. name	Vernacular name	English name	Scientific name	Parts use	Mode of preparation	Disease cure	Day of use	RFC	FL (%)UV
1	Hathi	Elephant	<i>Elephas maximus</i> Linnaeus, 1758	Dung	Dung ash mix with coconut oil	Tinea/Fungal skin disease	Apply for 15-25 days	0.219	21.875 0.016
2	Belara Musa	Giant Squirrel	<i>Rattus indica</i> (Erxleben, 1777)	Musk	Raw	Antifertility		0.063	6.25 0.016
3	Pangolin	Pangolin	<i>Manis crassicaudata</i> E. Geoffroy, 1803	Scale	Scrape and apply	Lumbago	2/day	0.016	1.563 0.016
4	Jhinka	Porcupine	<i>Hystrix indica</i> Kerr, 1792	Intestine with honey	Grinding and mix	Smallpox	2-3 times/day	0.031	3.125 0.047
5	Jhinka	Porcupine	<i>Hystrix indica</i> Kerr, 1793	Meat	Direct	Myalgia	2/day	0.016	1.563 0.047
6	Jhinka	Porcupine	<i>Hystrix indica</i> Kerr, 1794	Bile	Mix with water	Arthritis	Once	0.25	25 0.047
7	Sambar	Sambar	<i>Rusa unicolor</i> (Kerr, 1792)	Body fat	Lotion	Skin disease	2 times per day for 7 days	0.047	4.688 0.047
8	Sambar	Sambar	<i>Rusa unicolor</i> (Kerr, 1792)	Intestine	Decoction	Abdominal pain (Colic)	Once/day	0.016	1.563 0.094
9	Sambar	Sambar	<i>Rusa unicolor</i> (Kerr, 1792)	Horn	Scrape and apply	Angina pectoris	2/day	0.016	1.563 0.094
10	Pani Musha	Small Clawed Otter	<i>Aonyx cinereus</i> (Illiger, 1815)	Blood	Raw	Pulmonary tuberculosis/ Cancer	Once in a week	0.031	3.125 0.016
11	Bagha	Tiger	<i>Panthera tigris</i> (Linnaeus, 1758)	Tongue	Grinding	Asthma	Once	0.031	3.125 0.094
12	Bagha	Tiger	<i>Panthera tigris</i> (Linnaeus, 1758)	Tongue	Grinding and mix with Shorea robusta leaves 2 drops in nose	Smallpox	Thrice a day	0.016	1.563 0.094
13	Bagha	Tiger	<i>Panthera tigris</i> (Linnaeus, 1758)	Tongue	Grind and apply	Epilepsy	Thrice a day	0.016	1.563 0.094
14	Bagha	Tiger	<i>Panthera tigris</i> (Linnaeus, 1758)	Meat	Raw	Deglutition	Once in a day for seven days	0.016	1.563 0.094
15	Bagha	Tiger	<i>Panthera tigris</i> (Linnaeus, 1758)	Body Fat	One tea spoon fatty oil	Syncope	Thrice in a day for seven days	0.016	1.563 0.094
16	Bagha	Tiger	<i>Panthera tigris</i> (Linnaeus, 1758)	Bile	Mixed with rice	Pulmonary tuberculosis	One doses for three days	0.016	1.563 0.094
17	Barha	Wild Boar	<i>Sus scrofa</i> Linnaeus, 1758	Teeth	Scrape and apply	Boils	2/day	0.094	9.375 0.016

Table 3. Status of plants and animals used for traditional medicinal practices by Kandha community of Odisha

Sl.No.	Family	Scientific name	Vernacular name	English name	IUCN Status
1	Malvaceae	<i>Abutilon indicum</i> (Link) Sweet	Pedi Pedika	Indian Mallow	Not evaluated
2	Mimosaceae	<i>Acacia catechu</i> (L.f.) Hutter & Mabb.	Khaira	Black Cutch	Not evaluated
3	Acanthaceae	<i>Adhatoda vasica</i> (L.) Nees	Basanga	Malabar nut	Not evaluated
4	Rutaceae	<i>Aegle marmelos</i> (L.) Corrêa	Bela	Apple wood	Not evaluated
5	Liliaceae	<i>Allium cepa</i> L.	Piyaja	Onion	Not evaluated
6	Apocynaceae	<i>Alstonia scholaris</i> (L.) R.Br.	Chati Ana	Blackboard tree	Not evaluated
7	Zingiberaceae	<i>Amomum aromaticum</i> Roxb.	Bada Aleicha	Bengal cardamom	Not evaluated
8	Acanthaceae	<i>Andrographis paniculata</i> (Burm.f.) Wall. ex Nees	Bhuini nimba	India echinacea	Not evaluated
9	Liliaceae	<i>Asparagus racemosus</i> Willd.	Satbari	Asparagus	Not evaluated
10	Meliaceae	<i>Azaadirachta indica</i> A.Juss.	Nimba	Margosa Tree	Not evaluated
11	Berberidaceae	<i>Berberis asiatica</i> Roxb. ex DC.	Daru haladi	Tree Turmeric	Not evaluated
12	Fabaceae	<i>Butea monosperma</i> (Lam.) Taub.	Gandha Palasa	Flame of the Forest	Not evaluated
13	Arecaceae	<i>Calamus tenuis</i> Roxb.	Beta	May dang	Least Concern
14	Celastraceae	<i>Celastrus paniculatus</i> Willd.	Pengu	Black-Oil tree	Not evaluated
15	Asteraceae	<i>Chrysanthemum coronarium</i> L.	Bana sebati	Crown daisy	Not evaluated
16	Lauraceae	<i>Cinnamomum tamala</i> (Buch.-Ham.) T.Nees & C.H.Ebrem.	Tejaraja/Tejapatra	Indian Bay leaf	Not evaluated
17	Vitaceae	<i>Cissus quadrangularis</i> L.	Pangu /hada penguli	Devil's backbone	Not evaluated
18	Rutaceae	<i>Citrus limon</i> (L.) Burn.	Lembu	<i>Lemon</i> of India	Not evaluated
19	Menispermaceae	<i>Cocculus hirsutus</i> (L.) Diels	Dahi dahia	Broom Creeper	Not evaluated
20	Capparaceae	<i>Crataeva nurvala</i> Buch.-Ham.	Baruna	Three leaved caper	Not evaluated
21	Euphorbiaceae	<i>Croton sparsiflorus</i> Morong	Lankajoda	Kowli seeds	Not evaluated
22	Amaryllidaceae	<i>Curculigo orchoides</i> Gaertn.	Tala Muli	Golden eye-grass	Not evaluated
23	Zingiberaceae	<i>Curcuma aromatica</i> Salisb.	Bana Haladi	Wild turmeric	Not evaluated
24	Euphorbiaceae	<i>Euphorbia antiquorum</i> L.	Sijihu	Triangular Spurge	Not evaluated
25	Moraceae	<i>Ficus hispida</i> L.f.	Dimiri	Hairy Fig	Not evaluated
26	Rubiaceae	<i>Gardenia florida</i> L. nom. illeg.	Sugandhi	<i>Gardenia</i>	Not evaluated
27	Asclepiadaceae	<i>Gymnema syvestre</i> R. Br.	Guda Mari	Periploca of the woods	Not evaluated
28	Apocynaceae	<i>Hemidesmus indicus</i> (L.) R.Br.	Ananta Mula	Indian Sarsaparilla	Not evaluated
29	Malvaceae	<i>Hibiscus rosa-sinensis</i> L.	Mandara	China rose	Not evaluated

SL.No.	Family	Scientific name	Vernacular name	English name	IUCN Status
1	Elephantidae	<i>Elephas maximus</i> Linnaeus, 1758	Hathi	Asian Elephant	Endangered
2	Sciuridae	<i>Ratufa indica</i> (Erxleben, 1777)	Belara Mussa	Giant Squirrel	Least Concern
3	Manidae	<i>Manis crassicaudata</i> E. Geoffroy, 1803	Pangolin	Pangolin	Endangered
4	Hystricidae	<i>Hystrix indica</i> Kerr, 1794	Jhinka	Porcupine	Least Concern
5	Cervidae	<i>Rusa unicolor</i> (Kerr, 1792)	Sambar	Sambar	Vulnerable
6	Mustelidae	<i>Aonyx cinereus</i> (Illiger, 1815)	Pani Musha	Small Clawed Otter	Vulnerable
7	Felidae	<i>Panthera tigris</i> (Linnaeus, 1758)	Bagh	Tiger	Endangered
8	Suidae	<i>Sus scrofa</i> Linnaeus, 1758	Barha	Wild Boar	Least Concern
